

Software Engineer with experience across full-stack product development and platform engineering. I focus on improving reliability, developer experience, and delivery workflows by strengthening engineering foundations, automating processes, and shaping internal tooling. My background in both product and platform work gives me a holistic perspective on software delivery and helps me collaborate effectively across teams. My goal is always the same: reduce friction, shorten the feedback loop, and let engineers focus on shipping value rather than fighting infrastructure.

Work Experience

Senior Platform Engineer Platform Team	Powerus Berlin, Germany	Nov 2024 – Present
- Improved developer experience by introducing preview environments for every PR and modernizing local development with production-like setups, real domains, and Cloudflare tunnels, shortening onboarding time and significantly reducing the feedback loop. - Migrated our infrastructure from DigitalOcean to AWS and shifted the architecture to Kubernetes with zero downtime, modernizing the platform and enabling self-service, faster experimentation, and improved incident response. - Revamped CI/CD pipelines, cutting P95 from 20 to 10 minutes and reducing CI costs by 40% through caching improvements and E2E sharding - Rolled out continuous deployment, increasing deployment frequency from 1–2/day to 20–25/day and reducing release risk. - Built internal tooling and platform packages for monitoring, integrations, and framework upgrades, and provided day-to-day platform support across teams. - Organized hands-on Kubernetes and AWS workshops and created a platform guild to spread platform knowledge and build team autonomy in our product squads.		
Senior Full-Stack Engineer Marketplace Squad	Powerus Berlin, Germany	May 2023 – Nov 2024
- Led improvements to the job matching system, reducing average execution time by 68% and enhancing content delivery and personalization. - Introduced Terraform to manage infrastructure as code, improve infrastructure visibility and enable reproducible environment provisioning. - Set up Storybook infrastructure with visual testing for our design system, and migrated our frontends to Angular 17, reducing build times by 50%. - Supported data and DevOps initiatives, including internal tooling, datadog integrations in the stack.		
Full-Stack Engineer Network Squad	Powerus Berlin, Germany	Oct 2022 – May 2023
- Led the development and launch of the iOS mobile app using CapacitorJS, with support for live updates of non-native code. - Enhanced user retention features by building community tools (video uploads, reporting system) and integrating education modules in the product. - Improved CI/CD pipelines from 50 mins to 20 mins, reduced E2E test flakiness, and automated mobile builds with GitHub Actions and Fastlane. - Upgraded Angular (v12→v16), introduced runtime secret management, and actively contributed to the DevOps guild (Vault, CI improvements, setup new environments)		

Junior Full-Stack Engineer

Acquisition Squad

Powerus

Berlin, Germany

Jul 2022 - Oct 2022

- Contributed to user acquisition efforts by building and improving sign-up funnels, landing pages, and the public job search experience.
- Developed a new public job search page to streamline user onboarding.
- Integrated Google Ads to align marketing efforts with product features.
- Refactored frontend components to improve maintainability and align with the new architecture.
- Actively participated in planning, ideation, and estimation meetings.

Junior Full-Stack Engineer

R-D department

Apollo Coding Life

Lyon, France

Sep 2021 - Jun 2022

- Contributed to full-stack development across healthcare, energy, and enterprise projects, translating business needs into robust software solutions.
- Built an internal communication platform with role-based access and Microsoft Graph API integration (React, .NET 6, SQL Server, Azure).
- Participated in revamping a health insurance sign-up/quote flow, upgrading Angular and .NET stacks for improved UX and performance.
- Developed a quote generation tool for AC systems (SelectClim), later integrated into the REXEL marketplace; worked in an Agile team using Angular 13, .NET 6, and Cucumber.js.

Technologies and Languages

- **Programming Languages:** Typescript, C#, Python, Bash, Jsonnet, Yaml, HTML, SCSS
- **Technologies/Tools:** NestJS, Angular, React, .NET, MongoDB, Postgres, Kubernetes, Terraform, Docker, ArgoCD, Karpenter, AWS, Datadog, Sentry, Nginx, Helm, DigitalOcean, Linux, Github Actions, Drone CI, Jest, Playwright, Cypress, Storybook, RabbitMQ, NX monorepo, Hashicorp Vault, Cloudflare, Grafana, VictoriaMetrics, Loki
- **Spoken languages:** French (native), English (fluent)

Projects

Nexus

Jun 2025 - Present

A personal platform applying cloud and platform engineering concepts, reusable across side projects.

- Built a reusable K3S platform in Hetzner using Terraform, ArgoCD, Ingress NGINX, Github Actions. Using Cloudflare tunnels for secure access.
- Implemented an observability stack (Grafana, VictoriaMetrics, Loki) and automated backup processes.
- Created internal tools using Appsmith, including an S3 client and project utilities.
- Developed reusable Helm-like charts, including a custom Supabase chart, to standardize deployments across personal projects.
- Deployed side projects (e.g., my portfolio) on the platform to validate workflows end-to-end.
- Created a documentation with MkDocs Material

Education and Certifications

- **M.Sc. General Engineering**, ECAM, Lyon.

2017–2022
