Senior Platform Engineer with a full-stack background, grown into platform naturally after years in product engineering. I focus on the tooling, pipelines, and systems that make engineering teams move faster and more confidently, and my product background keeps me grounded in what developers actually need day to day.

Work Experience

Senior Platform Engineer

Platform Team

Powerus

Berlin, Germany

Nov 2024 – Present

- Designed and rolled out **PR preview environments** and improved local development with production-like setups, real domains, and Cloudflare tunnels, reducing onboarding time and accelerating feedback loops.
- Led the migration from DigitalOcean to AWS and moved our architecture to Kubernetes with zero downtime, enabling self-service, faster experimentation, and improved incident response.
- Revamped CI/CD pipelines, cutting P95 from **20 to 10 minutes** and reducing CI costs by **40%** through caching improvements and E2E sharding.
- Enabled continuous deployment, increasing deployment frequency from **1–2/day** to **20–25/day** and reducing release risk.
- Built internal backend and frontend platform packages (monitoring, integrations, framework upgrades) and provided day-to-day platform support across product teams.
- Owned the security posture of the platform, implementing zero-trust access with Cloudflare (Access, WARP), private-only infrastructure, and VPC-based operational access for critical systems.
- Organized hands-on Kubernetes and AWS workshops and created a platform guild to spread platform knowledge and build team autonomy in our product squads.

Senior Full-Stack Engineer

Marketplace Squad

Powerus

Berlin, Germany

May 2023 – Nov 2024

- Led improvements to the job matching system, reducing average execution time by **68%** and enhancing content delivery and personalization.
- Introduced Terraform to manage infrastructure as code, improve infrastructure visibility and enable reproducible environment provisioning.
- Set up Storybook infrastructure with visual testing for our design system, and migrated our frontends to Angular 17, reducing build times by **50%**.
- Supported data and DevOps initiatives, including internal tooling, datadog integrations in the stack.
- Mentored and onboarded junior engineers on best practices, architecture, and product domain knowledge, enabling them to ship features independently and confidently.

Full-Stack Engineer

Network Squad

Powerus

Berlin, Germany

Oct 2022 – May 2023

- Owned the development and launch of the iOS mobile app using CapacitorJS, with support for live updates of non-native code.
- Enhanced user retention features by building community tools (video uploads, reporting system) and integrating education modules in the product.
- Improved CI/CD pipelines from **50 mins to 20 mins**, reduced E2E test flakiness, and automated mobile builds with GitHub Actions and Fastlane.
- Upgraded Angular (v12 to v16), introduced runtime secret management, and actively contributed to our DevOps stack (Vault, CI improvements, setup new environments)

Junior Full-Stack Engineer

Acquisition Squad

Powerus

Berlin, Germany

Jul 2022 - Oct 2022

- Contributed to user acquisition efforts by building and improving sign-up funnels, landing pages, and the public job search experience.
- Integrated Google Ads to align marketing efforts with the product features.
- Refactored frontend components to improve maintainability and align with the new architecture.

Junior Full-Stack Engineer

R-D department

Apollo Coding Life

Lyon, France

Sep 2021 - Jun 2022

- Contributed to full-stack development across healthcare, energy, and enterprise projects, translating business needs into robust software solutions.
- Built an internal application with role-based access and Microsoft Graph API integration (React, .NET 6, SQL Server, Azure).
- Participated in revamping a health insurance sign-up/quote flow, upgrading Angular and .NET stacks for improved UX and performance.
- Developed a quote generation tool for AC systems (SelectClim), later integrated into the REXEL marketplace; worked in an Agile team using Angular 13, .NET 6, and Cucumber.js.

Technologies and Languages

- **Languages & Scripting:** Typescript, Go, C#, Python, Bash, Jsonnet, Yaml
- **Cloud & Infrastructure:** AWS, Kubernetes, Terraform, Docker, ArgoCD, Helm, Karpenter, Linux, Cloudflare, Vault, Traefik, Caddy, Nginx, DigitalOcean, Hetzner
- **Observability & Reliability:** Datadog, Grafana, VictoriaMetrics, Loki, Sentry
- **Backend & Frontend:** NestJS, Angular, React, .NET, MongoDB, Postgres, RabbitMQ, Redis, NX monorepo
- **CI/CD & Testing:** GitHub Actions, Drone CI, Jest, Playwright, Cypress, Storybook
- **Spoken languages:** French (native), English (fluent)

Projects

Nexus

Jun 2025 - Present

Nexus is my personal internal developer platform, where I design and validate platform engineering concepts by running real applications in a production-like environment. ([code source](#))

- Designed and built a reusable internal developer platform using GitOps (Terraform, ArgoCD) to standardize deployments, environments, and workflows across multiple projects.
- Designed platform-level monitoring, logging, and tracing using a Grafana-based stack, along with backup strategies to operate applications reliably
- Implemented preview environments and CI/CD pipelines with GitHub Actions to validate changes and shorten feedback loops.
- Deployed and operated real applications (e.g. portfolio, backend services, kubernetes controllers) on the platform to validate architecture and workflows end-to-end.

Education and Certifications

- **M.Sc. General Engineering**, ECAM, Lyon.

2017–2022
